

Credit Name:CSE 2140

Assignment Name: Second mastery

The following questions can help you in thinking critically about your problem-solving processes:

Understanding the Problem

How did you approach understanding the challenge?

I started the assignment by looking at my previous assignments, looking at the code or algorithms of what I can reuse for this assignment.

Were there any parts of the problem you found confusing at first? If so, how did you resolve that confusion?

I found some parts confusing especially with the declaration part and the tax part.

Planning the Solution

Did you create a plan or break the problem into smaller steps before coding?

I took smaller steps before coding such as looking at my previous codes, but then after that I jumped straight into coding the new assignment.

How did you decide on the tools, data structures, or algorithms to use?

Most of them came from the textbook or my previous codes.

Implementation

Did you write the code in small pieces or attempt the entire solution at once?

I wrote the code in small pieces over multiple classes, but I look at my old codes as I work on the new assignment as a refreshment, if that counts as smaller pieces.

How did you test your solution along the way to make sure it was working?

I was just running my console everytime i could.

Overcoming Challenges

What part of the problem was the most difficult for you?

The most difficult part for me was the display part, of how the tax would show up as 8 decimals place, but I hard coded the code for it to be only 2 decimal places after.

How did you handle moments when you felt stuck or unsure of what to do next?

I asked the people around me or use AI to help me when I'm stuck.

Learning

Was there anything you learned that you think will help you with future challenges?

Fixing the decimals place to 2 places would definitely help in future assignments.
